INTRODUCTION:

Plants are one of the most important sources of medicines. The large numbers of drugs are derived today from plants, like morphine from Papaver somniferum, ashwagandha from Withania somnifera, ephedrine from Ephedra vulgaris, atropine from Atropa belladonna, reserpine from Roulphia serpentina etc. The medicinal plants are considered to be very rich sources of secondary metabolites (which are potential sources of drugs) and essential oils which are of therapeutic importance. The important advantages claimed for therapeutic uses of medicinal plants in various ailments are their safety besides being expensive, efficacy and their easy availability throughout the world. Because of these advantages the medicinal plants have been widely used by the traditional medical practitioners in their day to day practice.

The World Health Organization (WHO) defines traditional medicine as: The health practices approaches, knowledge and beliefs incorporating plant, animal and mineral based medicines, spiritual therapies, manual techniques and exercises, applied singularly or in combination to treat, diagnose and prevent illnesses or maintain well-being.

According to a survey of World Health Organization (WHO), the practitioners of traditional system of medicine treat about 80% of patients in India, 85% in Burma and 90% in Bangladesh. In traditional systems of medicine the Indian medicinal plants have been used in successful management of various disease conditions like bronchial asthma, chronic fever, cold, cough, malaria, dysentery, convulsions, diabetes, diarrhoea, arthritis, emetic syndrome, skin diseases, insect bite etc. and in treatment of gastric, hepatic, cardiovascular & immunological disorders.

Ocimum genus includes more than 150 species which are distributed in the tropical and subtropical regions of the world and from sea level upto 6000 feet. Ocimum sanctum L. (Tulsi), Ocimum gratissium (Ram Tulsi), Ocimum canum (Dulal Tulsi), Ocimum basilicum (Ban Tulsi), Ocimum kilimandscharicum Guerke (Kapoor Tulsi), Ocimum americanum, Ocimum canum, Ocimum micranthum and Ocinum micranum are examples of known important species of genus Ocimum which grow in different parts of the world and are known to have medicinal properties.

Ocimum kilimandscharicum Guerke, known as ‘Kapoori Tulsi’ in Hindi and ‘Camphor Basil’ in English, is an exotic plant mainly cultivated in south India, both in plains and hilly areas. This plant attracted attention as a source of camphor. This species has a strong but less pleasant flavor. It is an aromatic under shrub with pubescent quadrangular branchlets. This plant is easily recognized by its shrubby habit, growing up to eight feet tall.

COMMON NAMES:

The seed is prepared hygienically by using for not the nursery prepared in nurseries at marked hoes as tillage implements, edges are used. Seedbeds are used.

2. Establishing an Ocimum kilimandscharicum Guerke seedbed nursery

Seedlings are raised in seedbeds which are prepared by using specific equipment that depends on the land characteristics. Seedbeds can be prepared in nurseries at farmer and the nursery should be prepared by observing hygienic and careful seedling production that involves seed selection, site selection, and tillage and seed propagation.

a) Seed selection and preparation

Ocimum kilimandscharicum Guerke seeds are collected from mature plants. The seed is prepared hygienically by drying under shade, threshing, winnowing and storing.

b) Site selection

The site selected for raising a nursery should be free from contamination, too much manure and convenient enough to minimise any possible damage to the seeds or seedlings and can be easily accessed.

c) Land preparation

The seedbed should be firm and smooth and prepared properly to produce a suitable medium for seedling germination, establishment and growth.

The land is prepared in two successive stages that are primary and secondary tillage.

i. Primary tillage

This is undertaken to break-up the soil compaction, loosen the size of the soil clods and invert plant residues to decompose them. The soil moisture should be sufficient enough so that it crumbles when worked by farm implements. The selected site should be cleared to free the land from previous crops and other vegetation. Size of the nursery required on the land should be marked out first then using hoes as tillage implements; the marked land is prepared by digging and cross digging. The land should be free for a few days to allow the waste vegetation to rot.

ii. Secondary tillage

This is done to remove all kinds of waste materials on the tilled land, level it properly and prepare beds for plant propagation. By using forked hoes as tillage implements, the tilled land should be prepared by cross digging to remove all wastes. Seedbeds are raised and constructed measuring 1000 mm wide and of any convenient length; the implements are used to establish smoothness on the seedbeds land. Before sowing, the soils are improved by incorporating compost manure with the top layer of the soil.

Sowing the Ocimum kilimandscharicum Guerke seeds in the seedbed

The seeds of Ocimum kilimandscharicum Guerke cannot be sown directly to the soil because of its size so dry clean seeds are mixed with dry powdered soil and using the edge of a board or the back of a rake, make shallow furrows or drills or ‘valleys’ in the seedbed at a spacing of 150 mm. Sow the mixed seeds uniformly in the drills and do not cover with soil after sowing.

d) Sowing the Ocimum kilimandscharicum Guerke seeds in the seedbed

The seeds of Ocimum kilimandscharicum Guerke cannot be sown directly to the soil because of its size so dry clean seeds are mixed with dry powdered soil and using the edge of a board or the back of a rake, make shallow furrows or drills or ‘valleys’ in the seedbed at a spacing of 150 mm. Sow the mixed seeds uniformly in the drills and do not cover with soil after sowing.

After sowing the seeds, the soil is covered with dry mulch using either grass or soft banana leaves. The cover ensures protection from birds and direct sunlight, and also improves germination and growth. Germination is noticed
after 7-10 days and after a few days, removes the mulch cover and construct a shade over the seedbed.

e) Seedbed management Protection

 Watering

For Ocimum kilimandscharicum Guerke germination and growth sufficient water is required. Water should be applied by fine sprinkling of water in the early evening for the first one week and from the second week onwards, water should be applied for 3 days per week. Watering during sunlight should be avoided.

Aftercare

Germinating seedlings should not be mistaken with weeds so weeding hand should be done by hand regularly. Weeds are removed using a knife by cutting just below the ground level that appear in the seedbed.

Drainage

The pathways between seedbeds should be slightly sloped to ensure good drainage of water. The slope ensures that water logging does not occur in and around the beds.

f) Transplanting Ocimum kilimandscharicum Guerke seedlings

Once the seeds have germinated, the plant grows rapidly above the ground after 2 months and is ready for transplanting after 5-7 weeks in the seedbed. The land where the plants will be transplanted should be well prepared and free of waste materials. The seedlings are removed from the seedbed and moved to the transplanting site where they are kept in a shade for a day. Transplanting should be done when it is not too sunny, preferably in the evening and after transplanting, the maturation period of the plant is 4-6 months before the first harvest commences.

2. Growth and development of Ocimum kilimandscharicum Guerke plant

- Ocimum kilimandscharicum Guerke requires minimal care and pesticide control. Minimal clean manure should be applied. Records of any pre and post manure applications on the plots should be kept and a calendar of any manure applications prepared to ascertain consistency and yields changes. Once mature, it thrives as a perennial, and can be harvested 3 times in a year for more than 3 years.

</tbody>
</table>

The remaining Nitrogen is applied in three split doses by broadcast method after each of the three cuttings. Diseases, insect pests, nematodes, physiological disorders, if any and their control measures: Incidence of attack by seasonal mealy bugs and leaf rollers has been reported. The insects can be controlled by spraying 0.2% Malathion, or 10g of Asataf per 1L of water.

3. Harvest, post-harvest handling and processing of Ocimum kilimandscharicum Guerke plant leaves

During harvesting, the plants are cut 50 - 75 mm above the ground and collected in heaps where the leaves are plucked and air-dried under shade. Harvesting should be undertaken very early in the morning before sunrise to minimize wilting of leaves and loss of oil from volatisation when it is hot. After 5 years, the shrub can be cut off and the farm replanted when it is hot.

Protection

Minimal clean manure requires minimal care and pesticide control. Minimal clean manure should be applied. Records of any pre and post manure applications on the plots should be kept and a calendar of any manure applications prepared to ascertain consistency and yields changes. Once mature, it thrives as a perennial, and can be harvested 3 times in a year for more than 3 years.

### PHARMACOGNOSTIC STUDY:

Organoleptic Study:

Ocimum kilimandscharicum Guerke- Perennial herbs up to 1m tall.

Leaves: Green colour, odor aromatic, taste slightly bitter, Simple, elliptic-ovate (25-40 & 10-20mm) decussate, 3-4cm long, 8-1.2 cm broad, apex obtuse of acute, based obtuse or cuneate, margin serrate, pubescent with white hairs on both sides, much denser and longer on veins beneath, veins grooved above raised beneath; petiole 10-20mm long, hirsute with white long spreading hairs. Shown in figure 2.

Stem: Round-quadrangular, hirsute with sessile glands; indumentum of white long spreading hairs, becoming denser on inflorescence axis.

Inflorescence: Dense, verticils 2-10mm apart; bracts ovate 3-3.5 x 2.2-5.5 mm, apex acuminate, base attenuate, margin serrate with long white hairs; pedicel 2-3mm long in fruit ± the same length as calyx ; hirsute with white long hairs. Shown in figure 3.

AYurvedic Properties:

- Rasa : Tikta, Katu

© 2011, JDDT. All Rights Reserved

ISSN: 2250-1177 CODEN: JDDTAO

© 2011, JDDT. All Rights Reserved
Calyx: 2-3.5mm long at anthesis, 3.4-5 mm long in fruit; posterior lip rounded pubescent inside, glabrous on back with yellow sessile glands confined at base near pedicel; anterior lip with 2 median lanceolate teeth curved upwards, longer than the 2 lateral teeth, more or less equal to posterior, throat open, tube pubescent outside with or without sessile glands, with a ring of hairs at throat inside.

Figure 2: Leaves of Ocimum kilimandscharicum Guerke

Corolla: White with purple tinted, 3-4mm long, lobes pubescent on back; posterior lip with 2 ovate-oblong median lobes slightly larger than the 2 lateral lobes; anterior lip oblong; tube glabrous both sides.

Stamens: Posterior pair having a transverse hairy process near base.

Nutlet: Black ovoid, smooth or minutely tuberculate, producing mucilage when wet.

b) Histological Study:

Transverse section:

Leaf shows isobilateral lamina covered with cuticle; glandular trichomes with multicellular head and multicellular warty covering trichomes. Mid rib with arc shaped vascular bundle consisting of xylem and phloem. Three to four layers of collenchymatous tissue present on upper side of vascular bundle. Given in figure 3:

Figure 3: Transverse section of Leaf of Ocimum kilimandscharicum Guerke

Powder microscopy:

Greenish; microscopy shows multicellular and warty covering trichomes, diacytic stomata, sessile glandular trichomes and vessels with spiral thickenings and fragment of lamina.

Figure 4: Powder microscopy of Ocimum kilimandscharicum Guerke

CHEMICAL CONSTITUENTS:

Ocimum kilimandscharicum Guerke is characterized by presence of high amount of camphor in essential oil. It is pale yellow in color and its content varies in different samples from 61 to 80.5%. Leaves contain the maximum amount of camphor and oil followed by flowers; stems contain only minute quantities. It contains d-camphor, d-α-pinene, d-limonene, terpinolene and unidentified sesquiterpenes and sesquiterpenes of alcohols.

Analysis of Essential Oil: Analysis of the essential oil of Ocimum kilimandscharicum Guerke was done by Charles and Simon. Seventeen constituents were identified in the oils obtained from leaves and flowers, the compositions of which were quite similar with linalool as the major constituent. This study demonstrated the occurrence of a linalool-camphor type of Ocimum kilimandscharicum Guerke18, composition of constituents given in Table III.

**ETHNobotanical USEs:**

1. Pesticidal activity - Some local farmers also commonly mix stored foodstuff with dry leaves of *Ocimum* plant for protection against pests\(^{26,27}\).

2. Central nervous system activity - Ethnobotanical data base showed that *Ocimum kilimandscharicum* Gürke, has various CNS activities like: neurotoxic, antineuralgic, CNS stimulant, tranquilizer, anti-alzheimeran, sedative\(^{28}\).

3. Other activities –
   
   (a) The leaves of *Ocimum kilimandscharicum* Gürke have traditionally been used in East Africa for the treatment of various ailments including cold & cough, abdominal pains, measles and diarrhoea\(^{29}\).
   
   (b) *Ocimum kilimandscharicum* Gürke also have following activities against various organisms i.e. fungicide, antibacterial, insecticfuge, insecticide, irritant, nematicide, antifeedant and herbicide\(^{29}\).
   
   (c) The oil of *Ocimum kilimandscharicum* Gürke also possesses antibacterial and antifungal properties\(^{20}\).
   
   (d) The leaves of *Ocimum kilimandscharicum* Gürke are acrid, thermogenic, aromatic, insecticidal, antiviral, appetizing, ophthalamic and deodorant. It is useful in cough, bronchitis, foul ulcers and wounds, ophthalmopathy and vitiated conditions of ‘vata’\(^7,9,20,29\).
   
   (e) Ethnobotanical data base showed that *Ocimum kilimandscharicum* Gürke has various other activities like: analgesic, antiviral, antiseptic, anti-oxidant, allergenic, anti tumor and spasmodenic\(^{28}\).

**PHARMACOLOGICAL ACTIVITY:**

c) Anti-malarial:

- The use of plant extracts as repellents against malaria vectors have been advocated in different studies. The feeding inhibition of four years old *Ocimum kilimandscharicum* Gürke (OK) in liquid paraffin or glycerin was compared with N,N-diethyl-3-methylbenzamide (DEET) using cage evaluation method. The four years old extracts of *Ocimum kilimandscharicum* Gürke performed similarly when mixed either in glycerine or liquid paraffin. Blood feeding succession was highest in negative control (glycerine / liquid paraffin alone) while low in OK and DEET. Therefore, promotion of plant extracts for commercialization is of priority in rural Tanzania where whole plants are currently used as repellents against malaria vector\(^{30}\).

- Leaves and seeds of *Ocimum kilimandscharicum* Gürke were tested by thermal expulsion from modified traditional stoves showed significant repellency against *Anopheles gambiae lato* Giles (Diptera: Culicidae) 81.5% *Anopheles arabiensis* Patton and 18.5%. A latex square design was applied for randomly assigning the treatment and control plants to experimental houses over different nights\(^{31}\).

- Evaluations under field conditions confirmed high protective efficacy, enhanced feeding inhibition and house entry inhibition (Deterrence). Protection efficiency for *Culex quinquefasciatus* was 90.50% . This study shows the potential of crude extracts and whole plants of *Ocimum kilimandscharicum* Gürke for use in protecting against human bicing while the burning of plants reduces significantly the indoor resting mosquitoes\(^{32}\).

- Insecticidal:

  The bioactivity of materials from the leaves of *Ocimum kilimandscharicum* Gürke was tested against *Rhizophoru domnica* (Fabricius) (Coleoptera: Bostirchidae), *Sitophilus zeamais* Mots chulsky (Coleoptera: Curculionidae), *Sitotroga cerealella* (Olivier) (Lepidoptera: Gelechidae) in maize and sorghum grains in the laboratory. Exposure of adults of the three insect species to dried ground leaves and essential oil extract of *Ocimum kilimandscharicum* Gürke induced 100% mortality after 48h. All the plant materials were repellent to *Sitophilus zeamais* with the essential oil extract applied at 0.3g/250g of grain evoking the highest repellent action\(^{11}\).

- Antioxidant Property:

  Methanol extract of leaves of *Ocimum kilimandscharicum* Gürke exhibited activity in all the in vitro antioxidant assays but it was not as potent as butylated hydroxyl anisole (BHA). The phytochemicals found in extract are rich antioxidants and these extracts can be used as an effective preservative in food industry\(^{34}\).

- Antimicrobial Activity:

  Essential oil from aerial parts of *Ocimum kilimandscharicum* Gürke shows antimicrobial activity against Gram +ve bacteria (*Staphylococcus aureus*, *Enterococcus faecalis*), Gram –ve bacteria (*Escherichia coli*, *Pseudomonas aeruginosa*) and also against yeast *Candida albicans*\(^35\).

- Wound Healing activity:

  Aqueous extract of leaves shows wound healing activity at two different doses (200 and 400mg/kg) in three types of wound models on rats: the excision, incision and dead space wound model. Significant increase in skin breaking strength, granuloma breaking strength, wound contraction, dry granuloma weight and decreased in epithelization period was observed. Biochemical
parameters obtained from histological examination of granuloma tissue determination using Van Geison And Masson Trichome strains shows, viz; L-Hydroxypoline, Hexose amine, Asorobic acid and Malondialdehyde which confirmed its potential wound healing activity. Thus, it was found that enhanced wound healing may be due to free radical scavenging action and the antibacterial property of the phytoconstituents present in it, either due to their individual or additive effect.

**Antifungal Activity:**

*Ocimum kilimandscharicum* Guerke is active against *Aspergillus niger, Aspergillus fumigates, Candida albicans, Cryptococcus neoformans, Microsporum cassis, Sporotrichum schenckii*.

**OTHER STUDIES:**

(a) Infection potential and management of root knot nematode on camphor basil (*Ocimum kilimandscharicum Guerke*) was also studied in detail.

(b) Karyomorphological studies were done in the population of *Ocimum kilimandscharicum Guerke*.

(c) Clonal propagation of *Ocimum kilimandscharicum Guerke* by tissue culture was done.

(d) An efficient plant regeneration protocol from nodal explants of *Ocimum kilimandscharicum Guerke* has been developed.

**MARKETED FORMULATION:**

Using modern science and technology, a new brand of medicines called Naturub was developed from purified extracts of *Ocimum kilimandscharicum* Guerke based on the traditional knowledge & practices. Naturub is registered as a medicine. Naturub is certified and registered as the first natural product by the Pharmacy and Poisons Board of Kenya – it is sold widely in corporate retail chains in Kenya. Its balm is used for alleviating flu, cold, chest congestion, aches and pain, insect bites and muscular pain. While the ointment is used for the fast relief of muscular strain, rheumatism, arthritic joint, fibrosis, lumbago, neuralgia and sciatica.

**CONCLUSION:**

An attempt was made to address chemistry, pharmacology and tissue culture study of the *Ocimum kilimandscharicum*. Therefore, the review of plant *Ocimum kilimandscharicum* revealed that it has got a variety of medicinally significant constituents, which are being utilized in the field of different system of medicine. This comprehensive review article will be very useful in future to those researchers interested in validating the hidden truth which has not been scientifically validated. Eventually plant belonging to Ocimum genus could contribute a lot towards economy and healthy problem.

**ACKNOWLEDGEMENT**

The author wish to express their thanks to teaching and non teaching support staff of department of Pharmacognosy, IEC Group of Institutions, MTU. Also grateful to the NISCAIR and National Medical Library staff for their supportive assistance.
