ABSTRACT

The present manuscript describe simple, sensitive, rapid, accurate, precise and economical first derivative spectrophotometric method for the simultaneous determination of dicloxacillin and cefpodoxime proxetil in combined tablet dosage form. The derivative spectrophotometric method was based on the determination of both the drugs at their respective zero crossing point (ZCP). The first order derivative spectra was obtained in methanol and the determinations were made at 233.8 nm (ZCP of cefpodoxime proxetil) for dicloxacillin and 321 nm (ZCP of dicloxacillin) for cefpodoxime proxetil. The linearity was obtained in the concentration range of 10-80 μg/ml for dicloxacillin and 4-32 μg/ml for cefpodoxime proxetil. The mean recovery was 100.70 ± 0.38 and 99.90 ± 0.36 for dicloxacillin and cefpodoxime proxetil, respectively. The method was found to be simple, sensitive, accurate and precise and was applicable for the simultaneous determination of dicloxacillin and cefpodoxime proxetil in pharmaceutical tablet dosage form. The results of analysis have been validated statistically and by recovery studies.

Keywords: Dicloxacillin, Cefpodoxime proxetil, first order derivative spectrophotometric method, Tablet,

INTRODUCTION

Dicloxacillin(DCX) is chemically 9(2S,5R,6R)-6-[3-(2,6-dichlorophenyl)-5-methyl-1,2-oxazole-4-amido]-3,3-dimethyl-7-oxo-4-thia-1 azabicyclo[3.2.0] heptane-2-carboxylic acid 1, is a penicillinate resistant penicillin, used in the treatment of bacterial infections such as pneumonia and bone, ear, skin and urinary tract infection 2. It is official in IP and USP. IP 3 and USP 4 describe RP-HPLC method for its estimation. Literature survey reveals HPLC 5 method for determination of DCX in pharmaceutical dosage forms as well as in biological fluids. Literature survey also reveals spectrophotometric 6 and RP-HPLC 7,8 methods for determination of DCX with other drugs. Cefpodoxime proxetil (CEF) is chemically 1- (isopropoxy carbonyloxy) ethyl (6R,7R)-7-[2-(2-amino-4-thiazolyl)-(z)-2-(methoximinio) acetamido]-3-methoxymethyl-3-cephem-4-carboxylate 9, is a third generation cephalosporin antibiotic. It is used for infections of the respiratory tract, urinary tract and skin and soft tissues. It has greater activity against staphylococcus aureus 10. Cefpodoxime proxetil is official in IP and USP. IP 11 and USP 12 describe liquid chromatography method for its estimation. Literature survey reveals HPTLC 13 method for the determination of CEF. Literature survey also reveals RP-HPLC 14 and spectrophotometric 15 methods for determination of CEF with other drugs. The combined dosage forms of DCX and CEF are available in the market for the treatment of infections caused by susceptible micro-organisms Vis. Urinary tract infections and gonococcal urethritis. The combination of these two drugs is not official in any pharmacopoeia, hence no official method is available for the simultaneous estimation of DCX and CEF in their combined dosage forms. Literature survey does not reveal any simple spectrophotometric or other method for simultaneous estimation of DCX and CEF in combined dosage forms. The present communication describes simple, sensitive, rapid, accurate and economical spectrophotometric method based on dual wavelength spectrophotometric method for simultaneous estimation of both drugs in their combined tablet dosage forms.

MATERIALS AND METHODS

Apparatus

A shimadzu model 1700 (Japan) double beam UV/Visible spectrophotometer with spectral width of 2 nm, wavelength accuracy of 0.5 nm and a pair of 10 mm matched quartz cell was used to measure absorbance of all the solutions. Spectra were automatically obtained by UV-Probe system software. A Sartorius CP224S analytical balance (Gottingen, Germany), an ultrasonic bath (Frontline FS 4, Mumbai, India) was used in the study.

Reagents and Materials

DCX and CEF bulk powder was kindly gifted by Acme Pharmaceuticals Ltd. Ahmedabad, India. The commercial fixed dose combination product was procured from the local market. Methanol AR Grade was procured from S. D. Fine Chemicals Ltd., Mumbai, India.

Preparation of standard stock solutions

An accurately weighed quantity of DCX (10 mg) and CEF (10 mg) were transferred to a separate 100 ml volumetric flask and dissolved and diluted to the mark with methanol.
to obtain standard solution having concentration of DCX (100 μg/ml) and CEF (100 μg/ml).

**Methodology**

The standard solutions of DCX (10 μg/ml) and CEF (10 μg/ml) were scanned separately in the UV range of 200-400 nm. The zero-order spectra thus obtained was then processed to obtain first-derivative spectra. Data were recorded at an interval of 1 nm. The two spectra were overlain and it appeared that DCX showed zero crossing at 321 nm, while CEF showed zero crossing at 233.8 nm. At the zero crossing point (ZCP) of DCX (321 nm), CEF showed a first-derivative absorbance, whereas at the ZCP of CEF (233.8 nm), DCX showed a first-derivative absorbance. Hence 233.8 and 321 nm was selected as analytical wavelengths for determination of DCX and CEF, respectively. These two wavelengths can be employed for the determination of DCX and CEF without any interference from the other drug in their combined dosage formulations. 17

Validation of the proposed method

The proposed method was validated according to the International Conference on Harmonization (ICH) guidelines.\textsuperscript{18}

Linearity (Calibration curve)

The calibration curves were plotted over a concentration range of 10-80 µg/ml for DCX and 4-32 µg/ml for CEF. Accurately measured standard solutions of DCX (1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0 and 8.0 ml) and CEF (0.4, 0.8, 1.2, 1.6, 2.0, 2.4, 2.8 and 3.2 ml) were transferred to a series of 10 ml of volumetric flasks and diluted to the mark with methanol. First-derivative absorbance (D1) was measured at 233.8 nm for DCX and 321 nm for CEF. The calibration curves were constructed by plotting absorbances versus concentrations and the regression equations were calculated.\textsuperscript{18}

Method precision (repeatability)

The precision of the instrument was checked by repeated scanning and measurement of absorbance of solution (n = 6) for DCX and CEF (10 µg/ml) without changing the parameter of the first-derivative spectrophotometry method.\textsuperscript{18}

Intermediate precision (reproducibility)

The intraday and interday precision of the proposed method was determined by analyzing the corresponding responses 3 times on the same day and on 3 different days over a period of 1 week for 3 different concentrations of standard solutions of DCX and CEF (20, 50, 80 µg/ml for DCX and 8, 20, 32 µg/ml for CEF). The result was reported in terms of relative standard deviation (% RSD).

Accuracy (recovery study)

The accuracy of the method was determined by calculating recovery of DCX and CEF by the standard addition method. Known amounts of standard solutions of DCX and CEF were added at 50, 100 and 150 % level to prequantified sample solutions of DCX and CEF (30 µg/ml for DCX and 6 µg/ml for CEF). The amounts of DCX and CEF were estimated by applying obtained values to the respective regression line equations. The experiment was repeated for five times.\textsuperscript{18}

Limit of detection and Limit of quantification

The limit of detection (LOD) and the limit of quantification (LOQ) of the drug were derived by calculating the signal-to-noise ratio (S/N, i.e., 3.3 for LOD and 10 for LOQ) using the following equations designated by International Conference on Harmonization (ICH) guidelines.\textsuperscript{18}

\[
\text{LOD} = 3.3 \times \sigma/S \\
\text{LOQ} = 10 \times \sigma/S
\]

Where, \(\sigma\) = the standard deviation of the response and \(S\) = slope of the calibration curve.

Analysis of DCX and CEF in combined tablet dosage form

Twenty Tablets were weighed and powdered. The powder equivalent to 50 mg of DCX and 10 mg of CEF was transferred to a 100 ml volumetric flask. Methanol (50 ml) was added to it and sonicated for 20 min. The solution was filtered through Whatman filter paper No. 41 and the volume was adjusted up to the mark with methanol. This solution (1.0 ml) was taken in a 10 ml volumetric flask and the volume was adjusted up to mark with methanol to get a final concentration of DCX (50 µg/ml) and CEF (10 µg/ml). The responses of the sample solution were measured at 233.8 nm and 321 nm for quantification of DCX and CEF, respectively. The amounts of the DCX and CEF present in the sample solution were calculated by fitting the responses into the regression equation for DCX and CEF in the proposed method.\textsuperscript{18}

RESULTS AND DISCUSSION

The standard solutions of DCX and CEF were scanned separately in the UV range, and zero-order spectra (Figure 1) thus obtained was then processed to obtain first-derivative spectra. Data were recorded at an interval of 1 nm. The two derivative spectra showed maximum absorbance at 233.8 nm (ZCP of CEF) for DCX and 321 nm (ZCP of DCX) for CEF. First-derivative absorbances (D1) were recorded 233.8 nm for DCX and 321 nm for CEF (Figure 2). First derivative spectra give good quantitative determination of both the drugs at their respective without any interference from the other drug in their combined dosage formulations. Second and third-order derivative spectra of the drugs were not tested because the first-order spectra give satisfactory ZCPs and good quantitative determination of both the drugs without any interference.

Linear correlation was obtained between absorbances and concentrations of DCX and CEF in the concentration ranges of 10-80 µg/ml and 4-32 µg/ml, respectively. The linearity of the calibration curve was validated by the high values of coefficient of correlation (Table 3). The RSD values for DCX and CEF were found to be 0.058 and 0.282 %, respectively (Table 3). The low values of relative standard deviation (less than 2 %) indicate that the proposed method is repeatable. The low RSD values of interday (0.576-0.793 and 0.694-1.005 %) and intraday (0.212-0.565 and 0.344-0.827 %) for DCX and CEF, respectively, reveal that the proposed method is precise (Table 3). LOD values for DCX and CEF were found to be 0.56 and 0.64 µg/ml, respectively and LOQ values for DCX and CEF were found to be 1.70 and 1.93 µg/ml, respectively (Table 3). These data show that proposed method is sensitive for the determination of DCX and CEF.

The recovery experiment was performed by the standard addition method. The mean recoveries were 100.70 ± 0.38 and 99.90 ± 0.36 % for DCX and CEF, respectively (Table 1). The results of recovery studies indicate that the proposed method is accurate. The proposed validated method was successfully applied to determine DCX and CEF in their combined dosage form. The results obtained for DCX and CEF were comparable with the corresponding labeled amounts (Table 3). No interference of the excipients with the absorbance of interest appeared, hence the proposed method is applicable for the routine simultaneous estimation of DCX and CEF in pharmaceutical dosage forms.

CONCLUSION

Based on the results, obtained from the analysis of described method, it can be concluded that the method has linear response in the range of 10-80 µg/ml and 4-32 µg/ml for DCX and CEF, respectively with co-efficient of correlation, (r²)=0.9993 for DCX and CEF, respectively. The recovery experiment was performed by the standard addition method. The mean recoveries were 100.70 ± 0.38 and 99.90 ± 0.36 % for DCX and CEF, respectively (Table 1). The results of recovery studies indicate that the proposed method is accurate. The proposed validated method was successfully applied to determine DCX and CEF in their combined dosage form. The results obtained for DCX and CEF were comparable with the corresponding labeled amounts (Table 3). No interference of the excipients with the absorbance of interest appeared, hence the proposed method is applicable for the routine simultaneous estimation of DCX and CEF in pharmaceutical dosage forms.

ACKNOWLEDGEMENT

The authors are thankful to Acme Pharmaceuticals Ltd., Ahmedabad, Gujarat, India for providing gift sample of DCX and CEF for research. The authors are highly thankful to Center for Health Science Studies, Ganpat University, Kherva – 382711, Mehsana, Gujarat, India for providing all the facilities to carry out the work.
